Key macros to either insert or update one or more columns in a table. Input syntax

CSV2SQL(keymacro[,value1[,value2[,...]]]) where keymacro: The name of the keymacro, or a short (one word) text description of it. value1...: The values to insert or update. If a colon is used instead of a space before the values, the values are interpreted as a column-value-pair. Examples:
SQL2SQL(macro:COUNT) (macro:COUNT(*) would be identical) SQL2SQL(COUNT) SQL2SQL(COUNT) would produce the output SQL SELECT COUNT(*) FROM Tab1; The key macro can be found in the list below, or in the help or on the statusbar. List of all currently supported keymacro's: Note: Most keymacro's are valid for both column-value-pairs and for insert and update statements. Examples
Importing all columns from a file containing two columns with two rows into a table. Columns are selected from the input file: the name of the columns (from the first row), the type of the column (column1: character, column2: integer) and the length of the column (column1: 5 characters, column2: 2 characters). The file delimiter is a space, and a semicolon is used as column-separator.
CSV2SQL(Import:column1;column2:length) The result is: INSERT INTO Tab2 (column1, column2, length) VALUES ('Line1:11:23','Line1:22:33','Line1:123') ('Line2:111','Line2:222','Line2:333'); A simple select, with two columns and two rows. Column1: name of the column, column2: type of the column. A semicolon is used as file-delimiter and as column-separator. SQL2SQL(Select:name,type) The result is: SELECT name, type FROM Tab1; The syntax for Insert or Update statements. The file-delimiter is a space, and a semicolon is used as column-separator.
